Course: Design Patterns

Instructor: Dr. Youssef Senousy

1. Project Title

SocialEase – Social Anxiety Helper Web Application

2. Problem Statement

Many people suffer from social anxiety, which makes it difficult for them to interact with others, participate in social events, or even perform daily activities. Existing solutions often lack personalization and interactivity.

This project aims to develop a web application that provides a supportive, interactive, and personalized experience to help users gradually overcome social anxiety and improve their communication skills.

3. Project Objectives

Help users understand and track their anxiety levels

Provide daily exercises to improve confidence

Simulate real-life social scenarios

Track user progress over time

Offer personalized recommendations

4. Target Users

Teenagers and young adults

University students

Individuals experiencing social anxiety

Anyone seeking to improve communication and confidence

5. Technologies and Frameworks

Frontend: HTML, CSS, JavaScript (React optional)

Backend: Java (Spring Boot)

Database: MySQL or MongoDB

Tools: REST APIs, Git, GitHub

6. Expected Design Patterns

Singleton Pattern – for managing database connection

Factory Pattern – for creating different types of exercises

Observer Pattern – for notifying users about progress updates

Strategy Pattern – for applying different approaches based on user needs

MVC Pattern – for organizing the application structure

7. Initial High-Level System Overview

The system consists of the following modules:

User Module: Registration, login, profile

Assessment Module: Measures anxiety level

Exercise Module: Provides tasks and challenges

Progress Tracker: Shows improvement

Recommendation System: Suggests personalized activities
